Driving Networked Service Productivity Christofer F. Daiberl 2020-03-02 Christofer F. Daiberl explores how to enhance the productivity of services delivered by a network of co-providers. Harnessing empirical insights and synthesizing contributions from service design, information systems, and engineering, the author develops a systematic productivity improvement technique. The technique supports practitioners to iteratively discover and seize opportunities to enhance productivity for their own organization, customers, and relevant co-providers. Reflecting on the overall results, five general design principles are proposed that support the development of new artifacts fostering truly productive services in a networked world.

Teleology, First Principles, and Scientific Method in Aristotle's Biology Allan Gotthelf 2012-02-23 This volume presents an interconnected set of sixteen essays, four of which are previously unpublished, by Allan Gotthelf—one of the leading experts in the study of Aristotle's biological writings. Gotthelf addresses three main topics across Aristotle's three main biological treatises. Starting with his own ground-breaking study of Aristotle's natural teleology and its illuminating relationship with the *Generation of Animals*, Gotthelf proceeds to the axiomatic structure of biological explanation (and the first principles such explanation proceeds from) in the *Parts of Animals*. After an exploration of the implications of these two treatises for our understanding of Aristotle's metaphysics, Gotthelf examines important aspects of the method by which Aristotle organizes his data in the *History of Animals* to make possible such a systematic, explanatory study of animals, offering a new view of the place of classification in that enterprise. In a concluding section on 'Aristotle as Theoretical Biologist', Gotthelf explores the basis of Charles Darwin's great praise of Aristotle and, in the first printing of a lecture delivered worldwide, provides an overview of Aristotle as a philosophically-oriented scientist, and 'a proper verdict' on his greatness as scientist.

History and Precedent in Environmental Design Anatol Rapoport 2013-06-29 This book is about a new and different way of approaching and studying the history of the built environment and the use of historical precedents in design. However, although what I am proposing is new for what is currently called architectural history, both my approach and even my conclusions are not that new in other fields, as I discovered when I attempted to find supporting evidence. \* In fact, of all the disciplines dealing with various aspects of the study of the past, architectural history seems to have changed least in the ways I am advocating. There is currently a revival of interest in the history of architecture and urban form; a similar interest applies to theory, vernacular design, and culture-environment relations. After years of neglect, the study of history and the use of historical precedent are again becoming important. However, that interest has not led to new approaches to the subject, nor have its bases been examined. This I try to do. In so doing, I discuss a more rigorous and, I would argue, a more valid way of looking at historical data and hence of using such data in a theory of the built environment and as precedent in environmental design. Underlying this is my view of Environment-Behavior Studies (CEBS) as an emerging theory rather than as data to help design based on current "theory." Although this will be the subject of another book, a summary statement of this position may be useful.

Transformed Cladistics, Taxonomy and Evolution N. R. Scott-Ram 1990-03-30 This is an examination of the relationship between classification and evolutionary theory, with reference to the competing schools of taxonomic thinking. Emphasis is placed on one of these schools, the transformed cladists who have attempted to reject all evolutionary thinking in classification and to cast doubt on evolution in general. The author examines the limits to this line of thought from a philosophical and methodological perspective. He concludes that transformed cladistics does not achieve what it claims and that it either implicitly assumes a Platonic World View, or is unintelligible without taking into account evolutionary processes--the very processes it claims to reject. Through this analysis the author attempts to formulate criteria of an objective and consistent nature that can be used to judge competing methodologies and theories. Philosophers of science, zoologists interested in taxonomy, and evolutionary biologists will find this a compelling study.

The Prokaryotes M.P. Starr 2013-11-11 The purpose of this brief Foreword is to make you, the reader, hungry for the scientific feast that follows. These two volumes on the prokaryotes offer a truly unique scientific menu--a comprehensive assembly of articles, exhibiting the biochemical depth and remarkable physiological and morphological diversity of prokaryote life. The size of the volumes might initially discourage the unprepared mind from being attracted to the study of prokaryote life, for this landmark assemblage thoroughly documents the wealth of present knowledge. But in confronting the reader with the state of the art, the Handbook also defines where new work needs to be done on well-studied bacteria as well as on unusual or poorly studied organisms. There are basically two ways of doing research with microbes. A classical approach is first to define the phenomenon to be studied and then to select the organism accordingly. Another way is to choose a specific organism and go where it leads. The pursuit of an unusual microbe brings out the latent hunter in all of us. The intellectual challenges of the chase frequently test our ingenuity to the limit. Sometimes the quarry repeatedly escapes, but the final capture is indeed a wonderful experience. For many of us, these simple rewards are sufficiently gratifying so that we have chosen to spend our scientific lives studying these unusual creatures.
