Development of Flexibility Device Models for a Microgrid Laboratory Test Andrea Quattrone 2019 The world is facing a transition towards a more secure and sustainable future. The energy sector is leading this transition, pushed by the growth of renewable energies, the development of storage technologies and the spread of electric vehicles. However, the integration of these elements in the current power system is quite challenging and requires experts to design new and innovative solutions. In particular, the concepts of smart grids and flexibility are becoming popular and are seen as the possible solution to face this issue. Many projects worldwide are focusing on these topics and one of them is the INVADE,

financed by the EU within the Horizon 2020 program. This project is the framework under which the work for this master thesis has been completed. More specifically, the aim of this document is to develop emulators for 3 flexibility devices, a photovoltaic (PV) system, an electric vehicle (EV) charging station and a residential electric water heater (EWH). Together with a battery, these emulators are going to be used to set up a microgrid laboratory test and analyze a use case within the INVADÉ project. The emulators can simulate the behaviour of real devices and have been coded using C++ language. The set up of the microgrid laboratory test requires the completion of several steps, this master thesis attempts to complete the initial ones. The thesis is structured as follows. Section 1 includes an introduction about the current electric power system and the trends for the future. Section 2 contains a description of the laboratory test and its main objectives. Section 3, 4, 5 focus on the description and functioning of the PV system emulator, the EV charging station emulator and the EWH emulator, respectively. In each of these 3 sections a first part is dedicated to explain the technology and the state of the art, while the second part is focusing on the actual emulator, how it works and the logic behind the code. The complete codes can be found in the Appendix at the end of this document. Finally, Section 6 sums up the work done and outlines the future steps needed in order to set up and start the test.

The Romance of the New World Joan Pong Linton 1998-11-28 This book explores the lively interplay between popular romances and colonial narratives during a crucial period of English and colonial history. Joan Pong Linton argues that while the emergent romance figure of the husband embodies a new ideal of productive masculinity, colonial narratives, in putting this masculinity to the test, often contradict and raise doubts about the ideal. Study of these texts in the context of colonial experience reveals not just the "romance of empire" but also the impact of the New World on English identity.

Early North America (ENHANCED eBook) Tim McNeese 2002-09-01 This book provides a detailed and richly illustrated overview of the lives of the first Americans from their earliest migrations over the Bering land bridge to their initial encounters with European explorers. It traces the settlement of these early nomadic peoples across North America—the evolution of tools, the establishment of agriculture, and the rise of elaborate regional cultures. Styles of shelter, modes of travel and transport, and the prevalence of art and ornamentation suggest remarkable creativity and human ingenuity. Tribal beliefs, habits, practices, and unique structures of various tribal societies are discussed. The last third of the book documents European "discovery" of the New World, the often brutal rivalries among European colonizers, and the savage

treatment of native peoples. Challenging review questions encourage meaningful reflection and historical analysis. Maps, tests, answer key, extensive bibliography, and bonus timeline are included.

Twenty-First Century World Order and the Asia Pacific J. Hsiung 2001-08-10 After examining the global system's political

volatility at the dawn of the new millennium, the book looks at how some of the identifiable system-wide trends (e.g., globalization, democratization, fragmentation, etc.) may find repercussions in the Asia Pacific. The book also addresses the question of 'comprehensive security', in comparison with other regions, in a wide range of areas subsuming economic security (geoeconomics), environmental security (ecopolitics), and human security. In addition, the book recognizes the idiosyncrasies of the region, such as the defensiveness of most Asian governments toward the protection of their financial markets against external forces following the regional financial crisis of the late 1990s.

New Approaches of Testing for Financial Market Crisis and Contagion Yu-Ling Cody Hsiao 2014 This thesis consists of four chapters that focus on the development of new statistical frameworks or tests of financial market crisis and contagion. A new test for financial market contagion based on changes in the fourth order co-moments is proposed in chapter 2 to identify the propagation mechanism of shocks across international financial markets. The proposed approach captures changes in various aspects of the asset return relationships such as cross-market mean and skewness (co-kurtosis) as well as cross-market volatilities (co-volatility). In an empirical application involving the global financial crisis of 2008-09, the results show that significant contagion effects are widespread from the US banking sector to global equity markets and banking sectors through either the co-kurtosis or the co-volatility channel. Chapter 3 analyses nine financial crises from Asia in 1997-98 to the recent European debt crisis of 2010-13 to answer the question of whether the great recession is different to other crises in terms of a range of hypotheses regarding contagion transmission. This chapter examines financial contagion with a focus on the correlation and co-skewness change tests, and the proposed co-volatility change test in chapter 2 to capture changes in the various aspects of the asset return relationships. The empirical results indicate that the great recession and European debt crisis are truly global financial crises. Linkages through financial channels are more likely to result in crisis transmission than through trade, and crises beginning emerging markets transmit unexpectedly, particularly to developed markets. Chapter 4 introduces a new class of multiple-channel tests of financial market contagion in which the transmission channels of financial market crises are identified jointly through the correlation, co-skewness and co-kurtosis of the distribution of returns. The proposed tests yield the correct size in small samples which is typical of crisis periods. Regarding the power of the tests, the multiple-channel tests display the second highest power following the single-channel tests if the data generating process for an experiment contains the transmission channel of contagion consistent with the single-channel test. In an empirical application involving the three financial crises of 2007-12, the results show that the joint tests identify various combinations of transmission channels. Chapter 5 introduces new framework for testing for crisis and contagion using a regime switching skew-normal model (RSSN model). This new approach provides a more general framework for developing five types of crisis and contagion

channels simultaneously. Measuring financial contagion within the RSSN model can solve several econometric problems. These are i) market dependence is fully captured by simultaneously considering both second and third order co-moments of asset returns; ii) transmission channels are simultaneously examined; iii) crisis and contagion are distinguished and individually modelled; iv) the market that a crisis originates is endogenous; and v) the timing of a crisis is endogenous. By applying the proposed model to equity markets during the great recession using Bayesian model comparison techniques, the results generally show that crisis and contagion are pervasive across Europe and the US through the second and third moment channels during the great recession.

Research Design and Statistical Analysis Jerome L. Myers 2013-01-11 Research Design and Statistical Analysis provides comprehensive coverage of the design principles and statistical concepts necessary to make sense of real data. The book's goal is to provide a strong conceptual foundation to enable readers to generalize concepts to new research situations. Emphasis is placed on the underlying logic and assumptions of the analysis and what it tells the researcher, the limitations of the analysis, and the consequences of violating assumptions. Sampling, design efficiency, and statistical models are emphasized throughout. As per APA recommendations, emphasis is also placed on data exploration, effect size measures, confidence intervals, and using power analyses to determine sample size. "Real-world" data sets are used to illustrate data exploration, analysis, and interpretation. The book offers a rare blend of the underlying statistical assumptions, the consequences of their violations, and practical advice on dealing with them. Changes in the New Edition: Each section of the book concludes with a chapter that provides an integrated example of how to apply the concepts and procedures covered in the chapters of the section. In addition, the advantages and disadvantages of alternative designs are discussed. A new chapter (1) reviews the major steps in planning and executing a study, and the implications of those decisions for subsequent analyses and interpretations. A new chapter (13) compares experimental designs to reinforce the connection between design and analysis and to help readers achieve the most efficient research study. A new chapter (27) on common errors in data analysis and interpretation. Increased emphasis on power analyses to determine sample size using the G*Power 3 program. Many new data sets and problems. More examples of the use of SPSS (PASW) Version 17, although the analyses exemplified are readily carried out by any of the major statistical software packages. A companion website with the data used in the text and the exercises in SPSS and Excel formats; SPSS syntax files for performing analyses; extra material on logistic and multiple regression; technical notes that develop some of the formulas; and a solutions manual and the text figures and tables for instructors only. Part 1 reviews research planning, data exploration, and basic concepts in statistics including sampling, hypothesis testing, measures of effect size, estimators, and confidence intervals. Part 2 presents between-subject designs. The statistical models underlying the analysis of variance for these designs are emphasized, along with the role of expected mean squares in estimating effects of variables, the interpretation of interactions, and procedures for testing contrasts and controlling error rates. Part 3 focuses on repeated-measures designs and considers the advantages and disadvantages of different mixed designs. Part 4 presents detailed coverage of correlation and bivariate and multiple regression with emphasis on interpretation and common errors, and discusses the usefulness and limitations of these procedures as tools for prediction and for

developing theory. This is one of the few books with coverage sufficient for a 2-semester course sequence in experimental design and statistics as taught in psychology, education, and other behavioral, social, and health sciences. Incorporating the analyses of both experimental and observational data provides continuity of concepts and notation. Prerequisites include courses on basic research methods and statistics. The book is also an excellent resource for practicing researchers.
