Advanced Information Systems Engineering Anne Persson 2004-08-18 th CAiSE 2004 was the 16 in the series of International Conferences on Advanced Information Systems Engineering. In the year 2004 the conference was hosted by the Faculty of Computer Science and Information Technology, Riga Technical University, Latvia. Since the late 1980s, the CAiSE conferences have provided a forum for the presentation and exchange of research results and practical experiences within the ?eld of Information Systems Engineering. The conference theme of CAiSE 2004 was Knowledge and Model Driven Information Systems Engineering for Networked Organizations. Modern businesses and IT systems are facing an ever more complex en- ronment characterized by openness, variety, and change. Organizations are - coming less self-su?cient and increasingly dependent on business partners and other actors. These trends call for openness of business as well as IT systems, i.e. the ability to connect and interoperate with other systems. Furthermore, organizations are experiencing ever more variety in their business, in all c- ceivable dimensions. The di?erent competencies required by the workforce are multiplying. In the same way, the variety in technology is overwhelming with a multitude of languages, platforms, devices, standards, and products. Moreover, organizations need to manage an environment that is constantly changing and where lead times, product life cycles, and partner relationships are shortening. ThedemandofhavingtoconstantlyadaptlTtochangingtechnologiesandbu- ness practices has resulted in the birth of new ideas which may have a profound impact on the information systems engineering practices in future years, such as autonomic computing, component and services marketplaces and dynamically generated software.

M&A Capability Evolution Inga Voss 2007-12-10 Acquisitions are a highly risky venture and often result in failure. Recent theoretical and practical evidence, however, indicates that in the course of the current sixth merger wave some frequent acquirers have developed a specific M&A; capability. This capability enables them to outperform other, less capable frequent acquirers, as well as single acquirers. This phenomenon is largely unexplored. Inga Voss presents a mid-range theory of M&A; capability evolution based on an in-depth analysis in four of a large corporation's business groups. She develops an empirically grounded model of M&A; capability evolution and finds that different M&A; capability types evolve in the course of firms' acquisition strategies. On this basis, she develops a contingency model of M&A; capability evolution. The author further identifies two managerial engineering activities contributing to the evolution of successful M&A; capability. Lastly, she integrates the insights into a central frame (middle-up-down management) with which to achieve a balance between standardization and flexibility. Such a balance is regarded as vitally important for successful M&A; capability evolution. This study thus contributes to both theory and practice. In respect of theory, it contributes by shedding light on the insufficiently explored topics 'management of acquisition strategies', 'learning from M&A;', and 'dynamic capability evolution.' It links research on learning and capability evolution, thereby contributing to the repeatedly postulated convergence of different theoretical streams to gain interesting new insights in the strategy process field. In respect of practice, it contributes by providing managers with normative guidance regarding how to engineer the evolution of the M&A; capability type that suits their specific contextual challenges. This book is recommended for academics and students in the field of strategic management who are interested in M&A; and dynamic capabilities research. It also addresses practitioners who are searching for better ways to approach their M&A; management in accordance with their specific contextual challenges

Advances in Enterprise Information Systems II Charles Moller 2012-06-07 For many years now Enterprise Information Systems have been critical in helping businesses successfully navigate the global market. The development that started with design and implementation of integrated systems has evolved to incorporate a multitude of perspectives and ideas. The Enterprise Information Systems functionality extends from principally an ERP (Enterprise Resource Planning) system to a portfolio of standard systems including CRM (Customer Relationship Management) systems and SCM (Supply Chain Management) systems. Advances in Enterprise Information Systems II is divided into seven thematic sections, each exploring a distinct topic. In "Concepts in Enterprise Information Systems" the authors present new concepts and ideas for the field. "Cases in Enterprise Information Systems" introduces studies of enterprise information systems in an organizational context. "Business Process Management" is one of the major themes within enterprise information systems and "Designing Enterprise Information Systems" discusses new approaches to the design of processes and system and also deals with how design can be taken as a specific perspective. "Enterprise Information Systems in various domains" features generic studies that contribute to advancing the practical knowledge of the field as well as towards "Global issues of Enterprise Information Systems". Finally, in "Emerging Topics in Enterprise Information Systems", new technologies and ideas are explored. Cloud computing in particular seems to be setting the agenda for future research in enterprise information systems. The book will be invaluable to academics and professionals interested in recent developments in the field of enterprise information systems.
